The local interface and its various menus give access to all operating conditions of the unit. The test function allows you to perform a quick test of all the devices on the unit. If an operating condition of cooler error codes of chiller automatically returning to normality, or manually when the action has been taken on the unit. Alarms can be restored even if The unit is running. This means that an alarm can be restored without interruption, the unit is running. This means that an alarm can be restored without interruption and the unit is running. errors Active when o The supply is interrupted is saved and can in some cases prevent the restart of a circuit or one unit. A manual reset must be performed from the main interface using the following procedure: REVEN CARRIER, reset to active alarms bearer-reset alarms.
